1. Simple Protocol

This document describes the serial protocol of TWN4.

In order to operate this protocol, a firmware type TWN4_Cxvvv_PRSwww.bix is required, where vvv and www are the version numbers.

A firmware as mentioned above combines virtual USB (CDC) or true serial communication with a TWN4 app, which implements the simple protocol (PRS = PRotocol Simple).

This protocol is called simple because it is based on a communication with ASCII characters which can also be tested manually by using a terminal program. There is no additional overhead for things like packet repetition, address bytes...

The simple protocol is also available in binary mode. This means, that the data is not transmitted via ASCII characters but as single bytes.

Moreover it is possible to add a CRC at the end of every transmission. This lets you detect transmission errors.

The communication is based on a command/response structure: TWN4 will only send data to the host as a response of a command. Command and response are lines of bytes terminated by a carriage return. Carriage return is not shown explicitly anymore in the following documentation. A byte is always represented and transmitted by two hexadecimal ASCII characters.

1.1. Command

A command always starts with two bytes which reflect the API and function number to be executed.

1.2. Response

A response always starts with a byte, which reflects execution of the command on protocol level. Following possible error values:

| | |
|-----------------------|---|
| ERR_NONE | 0 |
| ERR_UNKNOWN_FUNCTION | 1 |
| ERR_MISSING_PARAMETER | 2 |
| ERR_UNUSED_PARAMETERS | 3 |
| ERR_INVALID_FUNCTION | 4 |
| ERR_PARSER | 5 |

1.3. Data Transmission

Data can be transmitted in two ways:

- by sending ASCII characters
- by sending binary values

Standard communication setting is **ASCII**, **CRC off** with **9600 baud**.

Communication settings can be done in the app **App_PRS104_Simple_Protocol.c** in the folder \Apps\Samples\Simple Protocol in the TWN4DevPack.

1.3.1. ASCII

To transmit a value of e.g. 0x1F, it is necessary to split this into two ASCII characters '1' and 'F'. These characters has to be sent sequentially.

1.3.2. Binary

To transmit a value of e.g. 0x1F, it can be sent directly in binary format. The first two bytes (LSB first) indicate the number of the following bytes.

<Length of command bytes (2 bytes, LSB first)> <command bytes>

See 1.3.4 for an example.

1.3.3. CRC

On both ASCII and binary format, a CRC can be added at the end of each transmission. In case of binary format, the length bytes are not part of the CRC calculation. The CRC is calculated as follows:

```
uint16_t UpdateCRC(uint16_t CRC,byte Byte)
{
    // Update CCITT CRC (reverse polynom 0x8408)
    Byte ^= (byte)CRC;
    Byte ^= (byte)(Byte << 4);
    return (uint16_t)((((Byte << 8) | (CRC >> 8)) ^ (Byte >> 4) ^ (Byte << 3)));
}
```

The CRC calculation starts with CRC = 0xFFFF

1.3.4. Reference messages

The following table shows reference messages for function GetUSBType

| Mode | CRC | Command (Host -> TWN4) | Response (TWN4 -> Host) |
|--------|-----|-------------------------------|-------------------------------|
| ASCII | Off | ""0005\r"" | ""0001\r"" |
| | On | ""000515A7\r"" | ""000131E1\r"" |
| Binary | Off | 0x02 0x00 0x00 0x05 | 0x02 0x00 0x00 0x01 |
| | On | 0x04 0x00 0x00 0x05 0x15 0xA7 | 0x04 0x00 0x00 0x01 0x31 0xE1 |

1.4. Data Types

The description of the commands is using data types, which have to be built-up as follows:

| Data Type | Description |
|--------------------------|--|
| [Byte]: | One single byte (sent as two hex digits) |
| [UInt16]: | Two bytes (LSB first) |
| [UInt32]: | Four bytes (LSB first) |
| [Bool]: | One single byte which can hold two values: 0 or 1 |
| [Byte Array(n)]: | A sequence of bytes with known and fixed number of bytes. The number of bytes is not transferred explicitly, because both host and TWN4 do know this number. |
| [Byte Array(Var)]: | A sequence of bytes, where the first byte holds the number of following bytes |
| [Byte Array(Var), x LB]: | A sequence of bytes, where the first x bytes hold the number of following bytes |
| [ASCII string]: | A sequence of bytes which contain ASCII characters, except the first byte which holds the number of following bytes |

In Simple Protocol, all numbers are sent with LSB first. For example, the number 0x1234 has to be sent as 3412.

1.5.1. API SYS

1.5.1.1. Reset

| | |
|----------------------------------|--------|
| Command: | [0001] |
| Response: | [00] |
| Example Command: Response: | 0001 |

1.5.1.2. StartBootloader

| | |
|-----------|--------|
| Command: | [0002] |
| Response: | [00] |
| Example | |
| Command: | 0002 |
| Response: | |

1.5.1.3. GetSysTicks

| | |
|-----------|-------------------------------|
| Command: | [0003] |
| Response: | [00][UInt32: <i>Ticks</i>] |
| Example | |
| Command: | 0003 |
| Response: | 00D3480700 (Ticks: 477395) |

1.5.1.4. GetVersionString

| | |
|-----------|---|
| Command: | [0004][Byte: <i>MaxLen</i>] |
| Response: | [00][ASCII string: <i>Version</i>] |
| Example | |
| Command: | 0004FF (MaxLen: FF) |
| Response: | 001D54574E342F42312E30332F434346312E35372F505253312E3033-2F5049 (Version: TWN4/B1.03/CCF1.57/PRS1.03/PI) |

1.5.1.5. GetUSBType

| | |
|-----------|--------------------------|
| Command: | [0005] |
| Response: | [00][Byte: <i>Type</i>] |
| Example | |
| Command: | 0005 |
| Response: | 0001 (Type: 1) |

1.5.1.6. GetDeviceType

| | |
|-----------|--------------------------|
| Command: | [0006] |
| Response: | [00][Byte: <i>Type</i>] |
| Example | |
| Command: | 0006 |
| Response: | 000B (Type: 11) |

1.5.1.7. Sleep

| | |

| Command: | [0007][UInt32: <i>Ticks</i>][UInt32: <i>Flags</i>] |
| Response: | [00][Byte: <i>Result</i>] |
| Example | |
| Command: | 0007E803000001000000 (Ticks: E8030000, Flags: 01000000) |
| Response: | 0000 (Result: 0) |

1.5.1.8. GetDeviceUID

| | |
|-----------|---|
| Command: | [0008] |
| Response: | [00][Byte Array(12): <i>UID</i>] |
| Example | |
| Command: | 0008 |
| Response: | 002D002F000B47303531353233 (UID: 2D002F000B47303531353233) |

1.5.1.9. SetParameters

| | |
|-----------|---|
| Command: | [0009][Byte Array(Var): <i>TLV</i>] |
| Response: | [00][Bool: <i>Result</i>] |
| Example | |
| Command: | 00090707010103010200 (TLV: 07010103010200) |
| Response: | 0001 (Result: true) |

1.5.1.10. GetLastError

| | |
|-----------|---------------------------------|
| Command: | [000A] |
| Response: | [00][UInt32: <i>LastError</i>] |
| Example | |
| Command: | 000A |
| Response: | 00CB000000 (LastError: 203) |

1.5.1.11. GetProdSerNo

| | |
|-----------|---|
| Command: | [000D][Byte: <i>MaxLen</i>] |
| Response: | [00][ASCII string: <i>SerNo</i>] |
| Example | |
| Command: | 000DFF (MaxLen: FF) |
| Response: | 001031323334353637383930313233343536 (SerNo: 1234567890123456) |

A. How to Set Specific Tags in Simple Protocol

The firmware function `SetTagTypes()` enables you to set specific transponder types to search for these types only. To set a specific transponder type, you need the definition for this type, which can be found in the table below.

A.1. Example with Enabling Only MIFARE

For a MIFARE transponder, the definition is as following:

| | |
|--------------|------|
| HFTAG_MIFARE | 0x80 |
|--------------|------|

With the TAGMASK definition ($1 \ll (\text{Tagtype} \& 0x1F)$) we can calculate:

$$1 \ll (0x80 \& 0x1F)$$

Result from $(0x80 \& 0x1F)$ is 0, so we shift 1 to the left for 0 places and we get 00000001 in binary, which is 00000001h.

Now we take this result and put it in `SetTagTypes` command from Simple Protocol.

```
[0502] [UInt32: TagTypesLF] [UInt32: TagTypesHF]
```

In this command it is stated that `HFTagTypes` is `UInt32`. Simple Protocol works with little endian, so instead of 00000001h it needs to be 01000000h.

Therefore to enable only Mifare following command should be sent (without the spaces):

```
0502 0000000000 01000000
```

where

0502 - command code

00000000 - means that none low frequency technology is enabled

01000000 - means that only Mifare from high frequency technologies is enabled

A.2. Example with Felica and HID Prox Only

Felica and HID Prox have the following definitions:

| | |
|---------------|------|
| HFTAG_FELICA | 0x85 |
| LFTAG_HIDPROX | 0x49 |

High Frequency:

With the TAGMASK definition ($1 \ll (\text{Tagtype} \& 0x1F)$) we can calculate:

$1 \ll (0x85 \& 0x1F)$

Result from $(0x85 \& 0x1F)$ is 5, so we shift 1 to the left for 5 places and we get 00100000 in binary, which is 00000020h.

HFTagTypes [UInt32] in little endian is now 20000000.

Low Frequency:

With the TAGMASK definition ($1 \ll (\text{Tagtype} \& 0x1F)$) we can calculate:

$1 \ll (0x49 \& 0x1F)$

Result from $(0x49 \& 0x1F)$ is 9, so we shift 1 to the left for 9 places and we get 0000001000000000 in binary, which is 00000200h.

LFTagTypes [UInt32] in little endian is now 00020000.

Correct command is (without the spaces):

0502 00020000 20000000

The following definitions can also be found in `twn4.sys.h`, which is part of the TWN4 Development Pack.

| Technology | Definition | Tagtype |
|------------|-----------------|---------|
| LF | LFTAG_EM4102 | 0x40 |
| | LFTAG_HITAG1S | 0x41 |
| | LFTAG_HITAG2 | 0x42 |
| | LFTAG_EM4150 | 0x43 |
| | LFTAG_AT5555 | 0x44 |
| | LFTAG_ISOFDX | 0x45 |
| | LFTAG_EM4026 | 0x46 |
| | LFTAG_HITAGU | 0x47 |
| | LFTAG_EM4305 | 0x48 |
| | LFTAG_HIDPROX | 0x49 |
| | LFTAG_TIRIS | 0x4A |
| | LFTAG_COTAG | 0x4B |
| | LFTAG_IOPROX | 0x4C |
| | LFTAG_INDITAG | 0x4D |
| | LFTAG_HONEYTAG | 0x4E |
| | LFTAG_AWID | 0x4F |
| | LFTAG_GPROX | 0x50 |
| | LFTAG_PYRAMID | 0x51 |
| | LFTAG_KERI | 0x52 |
| | LFTAG_DEISTER | 0x53 |
| | LFTAG_CARDAX | 0x54 |
| | LFTAG_NEDAP | 0x55 |
| | LFTAG_PAC | 0x56 |
| | LFTAG_IDTECK | 0x57 |
| | LFTAG_ULTRAPROX | 0x58 |
| | LFTAG_ICT | 0x59 |
| | LFTAG_ISONAS | 0x5A |
| HF | HFTAG_MIFARE | 0x80 |
| | HFTAG_ISO14443B | 0x81 |
| | HFTAG_ISO15693 | 0x82 |
| | HFTAG_LEGIC | 0x83 |
| | HFTAG_HIDICLASS | 0x84 |
| | HFTAG_FELICA | 0x85 |
| | HFTAG_SRX | 0x86 |
| | HFTAG_NFCP2P | 0x87 |
| | HFTAG_BLE | 0x88 |
| | HFTAG_TOPAZ | 0x89 |
| | HFTAG_CTS | 0x8A |
| | HFTAG_BLELC | 0x8B |
